Rain 0.1 0.5 1.0 2.0 3.0 5.0 10.0 15.0 20.0 25.0 30.0 [mm/hr]

We offer hourly global rainfall maps in near real time (about four hours after observation) using the combined MW-IR algorithm with [TRMM TMI](#), [Aqua AMSR-E](#), DMSP SSM/I and GEO IR data. This system was developed based on activities of the JST-CREST [GSMaP \(Global Satellite Mapping of Precipitation\)](#) project.

Description

Variable	:	Rainfall rate (mm/hr)
Domain	:	Global (60N - 60S)
Grid resolution	:	0.1 degree lat/lon
Temporal resolution	:	1 hour

ICHARM/PWRI

<http://sharaku.eorc.jaxa.jp/GSMaP/index.htm>

Algorithm for self-correction of satellite-based rainfall data without any ground-based rainfall data

Moving fast → Underestimation

Small spatial variance of cumulative rainfall

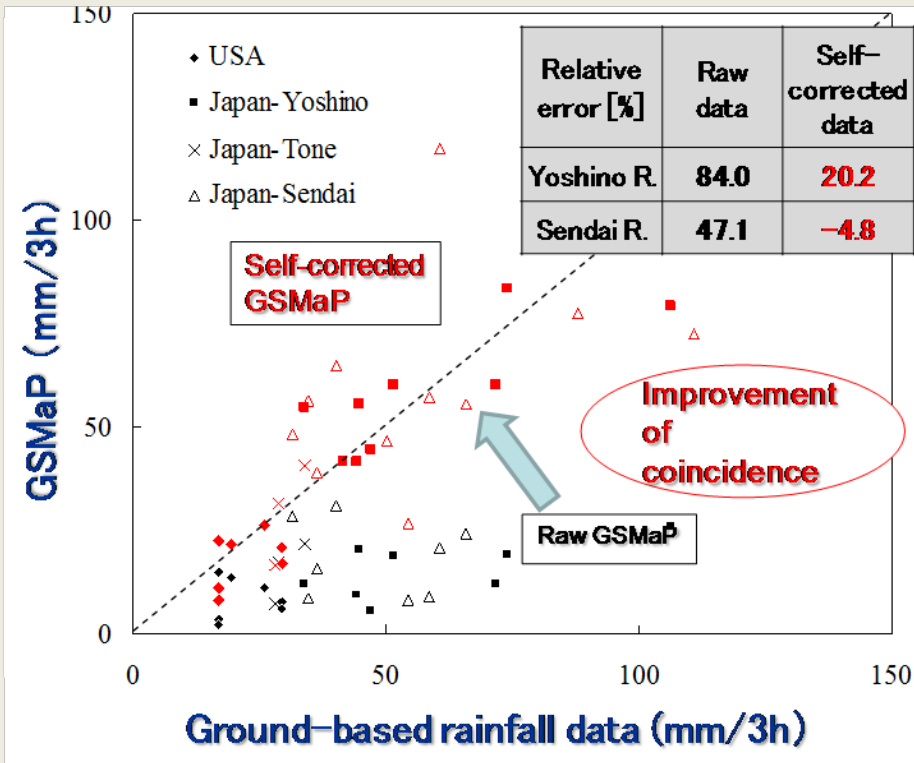

on a certain scale

Moving slowly → Better coincidence

Large spatial variance of cumulative rainfall

on a certain scale

A hypothesis on the reason why this self-correction is empirically effective.

Design concept of IFAS

1. To prepare interfaces to get **satellite-based rainfall data** in addition to ground-based rainfall data, to secure the worldwide availability of input data for flood forecasting/analysis system.
2. To adopt two types of **distributed-parameter hydrologic models, the parameters of which can be estimated as the first approximation based on globally-available GIS databases** to secure the worldwide availability of hydrologic models for flood forecasting/analysis.
3. To implement **GIS analysis modules in the system** to set up the parameters for the flood forecasting/analysis model, therefore no need to depend on external GIS softwares.
5. To prepare a series of easy-to-understand **graphical user interfaces** for data input, modeling, runoff-analysis, and displaying the outputs.
6. To distribute the executable program, **free of charge**, from the ICHARM/PWRI website

Flood runoff analysis model creation using global GIS data

31st in each

Calculation results : Kabul river in Pakistan

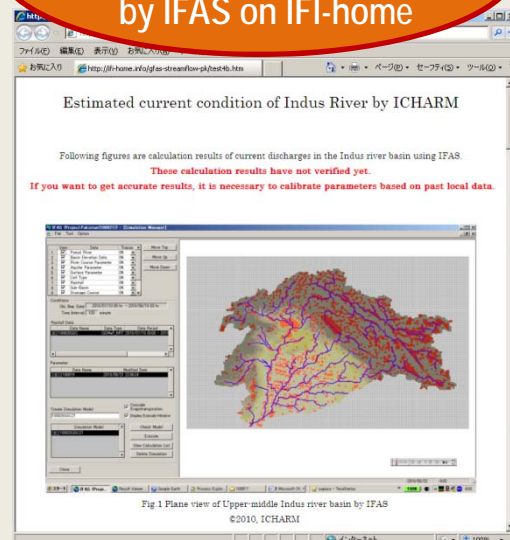

Ground rainfall is 2~7 times as many as GSMaP one. These rainfall are multiplied GSMaP by each thiesen area's ratio(Ground/GSMaP).

Estimated river discharge in Upper middle Indus river basin by IFAS on IFI-home

Though measured discharge broke off before peak, we can guess a certain extent of flood scale and duration by using IFAS.

GSMaP (original)	44.5	6.5
Ground-gauged	99.0	40.0
Rate(Ground/GSMaP)	2.22	6.14

19.5	69.8	338.0
63.0	4.84	
3.24	48.8	68.2
	333.0	28.9
	372.0	219.0
	6.82	5.45
		7.58

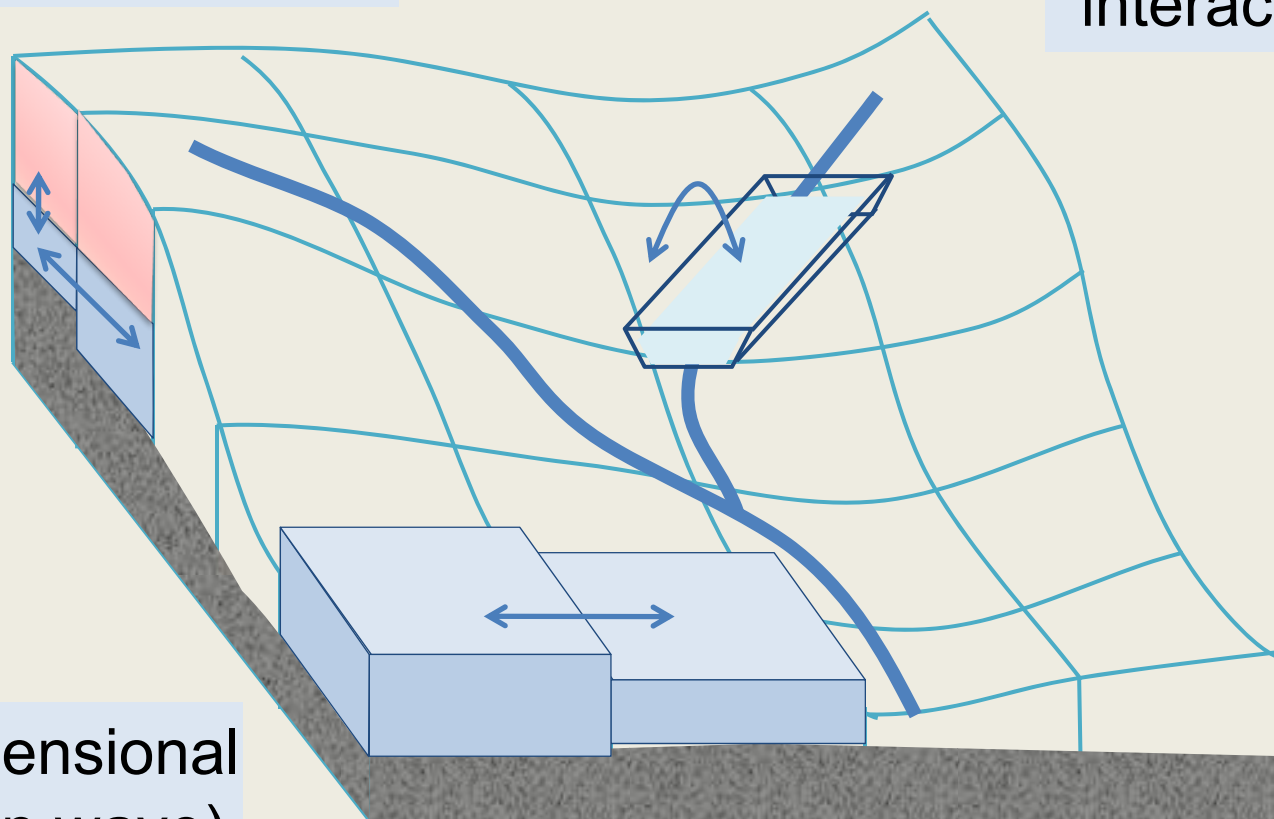

Another new approach: Rainfall-Runoff-Inundation Model

- Both river discharge and inundation are simulated simultaneously with rainfall input.
- The model is being developed for real-time flood predictions and/or quick estimations of flood extent immediately after flood disasters.
- It also utilizes globally available dataset; model application can be completed in a short time.

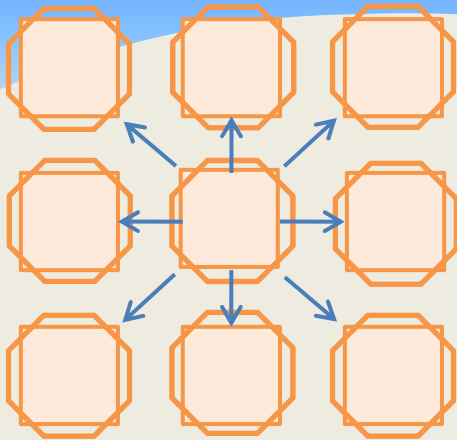

2D Rainfall-Runoff-Inundation Model

Subsurface flow
(Unsaturated, Saturated)

Slope - River
interaction

Two dimensional
(diffusion wave)

Mass balance

$$\frac{dh_i}{dt} = r_i - \frac{1}{A_i} \sum_j q_{ij} b_{ij}$$

r_i : Rainfall, h_i : Water depth, b_i : Width, A_i : Area

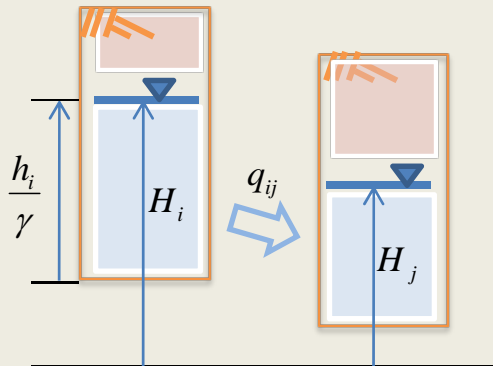

Saturated subsurface : Darcy Flow

$$q_{ij} = K_{eff} I_e h_i$$

K_{eff} : Saturated hydraulic conductivity

$$I_e = \frac{H_i - H_j}{L_{ij}} \text{ : Hydraulic gradient}$$

Octagon Grid: Quinn, Beven etal, Vol.5, 59 - 79, HP1991

Saturated subsurface, surface : Darcy + Manning Flow

$$q_{ij} = K_{eff} I_e h_i + \frac{1}{n} \sqrt{I_e} (h - d_A)^{5/3}$$

n : Surface roughness

d_A : Effective soil depth ($D \times \gamma$)

Global Data

Local Data

Conclusion

- The combination of satellite-based rainfall information, global GIS data and **IFAS (Integrated Flood Analysis System), a practical toolkit for local users, especially for developing countries to integrate all those global information**, has a very high potential to make prompt flood analyses even in poorly-gauged river basins.
- The application of a new Rainfall-Runoff-Inundation model was also successful to **interpolate missing satellite-based information on flood inundation area** caused by flash flood.
- On the other hand, it should be also noted that, without any **in-situ (ground-truth) data**, such integrated information & analysis cannot be assured, verified nor improved.
- It is, therefore, indispensable **to couple satellite & global GIS data with in-situ (geographical, geophysical and hydrologic) data** in order to improve the quality (accuracy) of the integrated information & analysis and to upgrade the range & depth of application. The importance of in-situ hydrologic data is everlasting.

Thank you for your attention!
