CEOP-AEGIS

Coordinated Asia-European long-term Observing system of Qinghai–Tibet Plateau hydro-meteorological processes and the Asian-monsoon system with Ground satellite Image data and numerical Simulations

www.ceop-aegis.org

18 research organizations in 8 countries

Massimo Menenti¹ Li Jia² and Jerome Colin³

¹Department of Earth Observation Systems, Delft University of Technology, The Netherlands

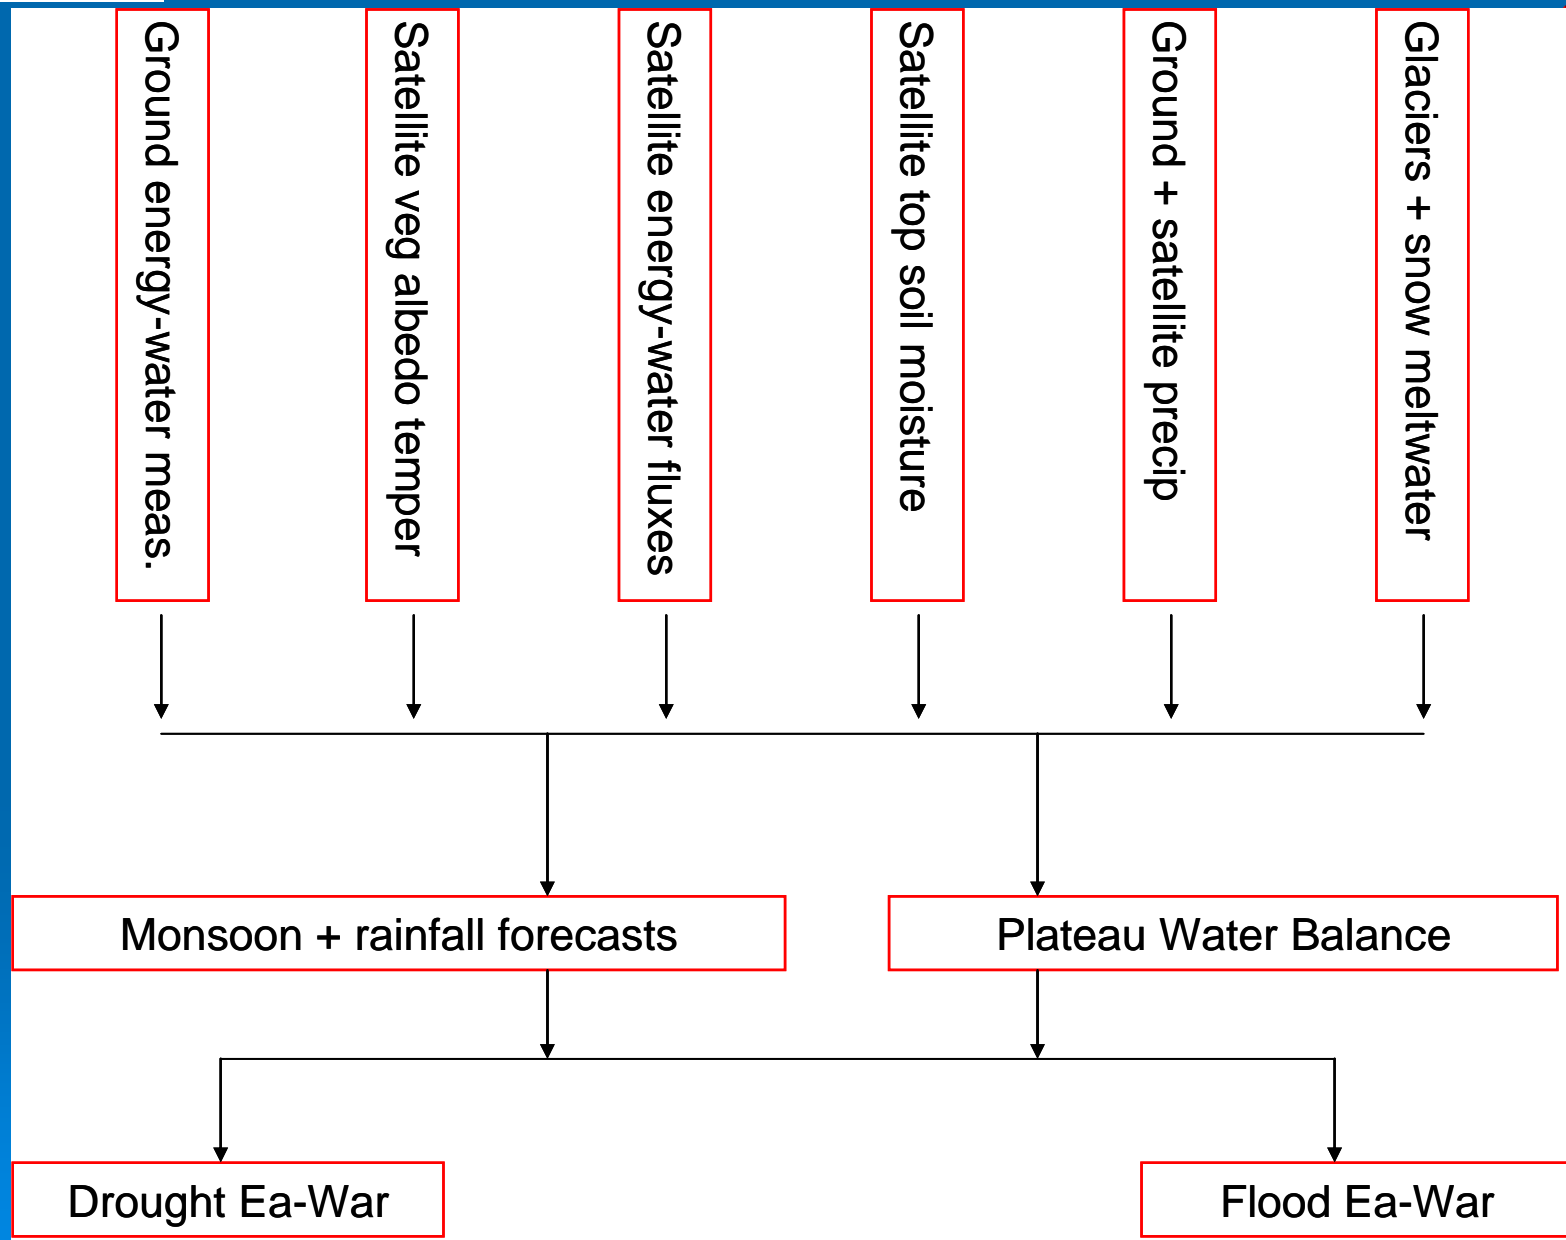

² Wageningen University and Research Centre, The Netherlands

³Laboratoire des Sciences de l'Image, de l'Informatique et de la Télédétection - LSIT, Université de Strasbourg, Illkirch, France

➤ Tibet Plateau :

- Headwater areas of seven major rivers in SE Asia
- Regulating area for the climate of China and of the Eastern Hemisphere as a whole
- Exert profound thermal and dynamical influences the onset, maintenance, and withdrawal of the monsoon

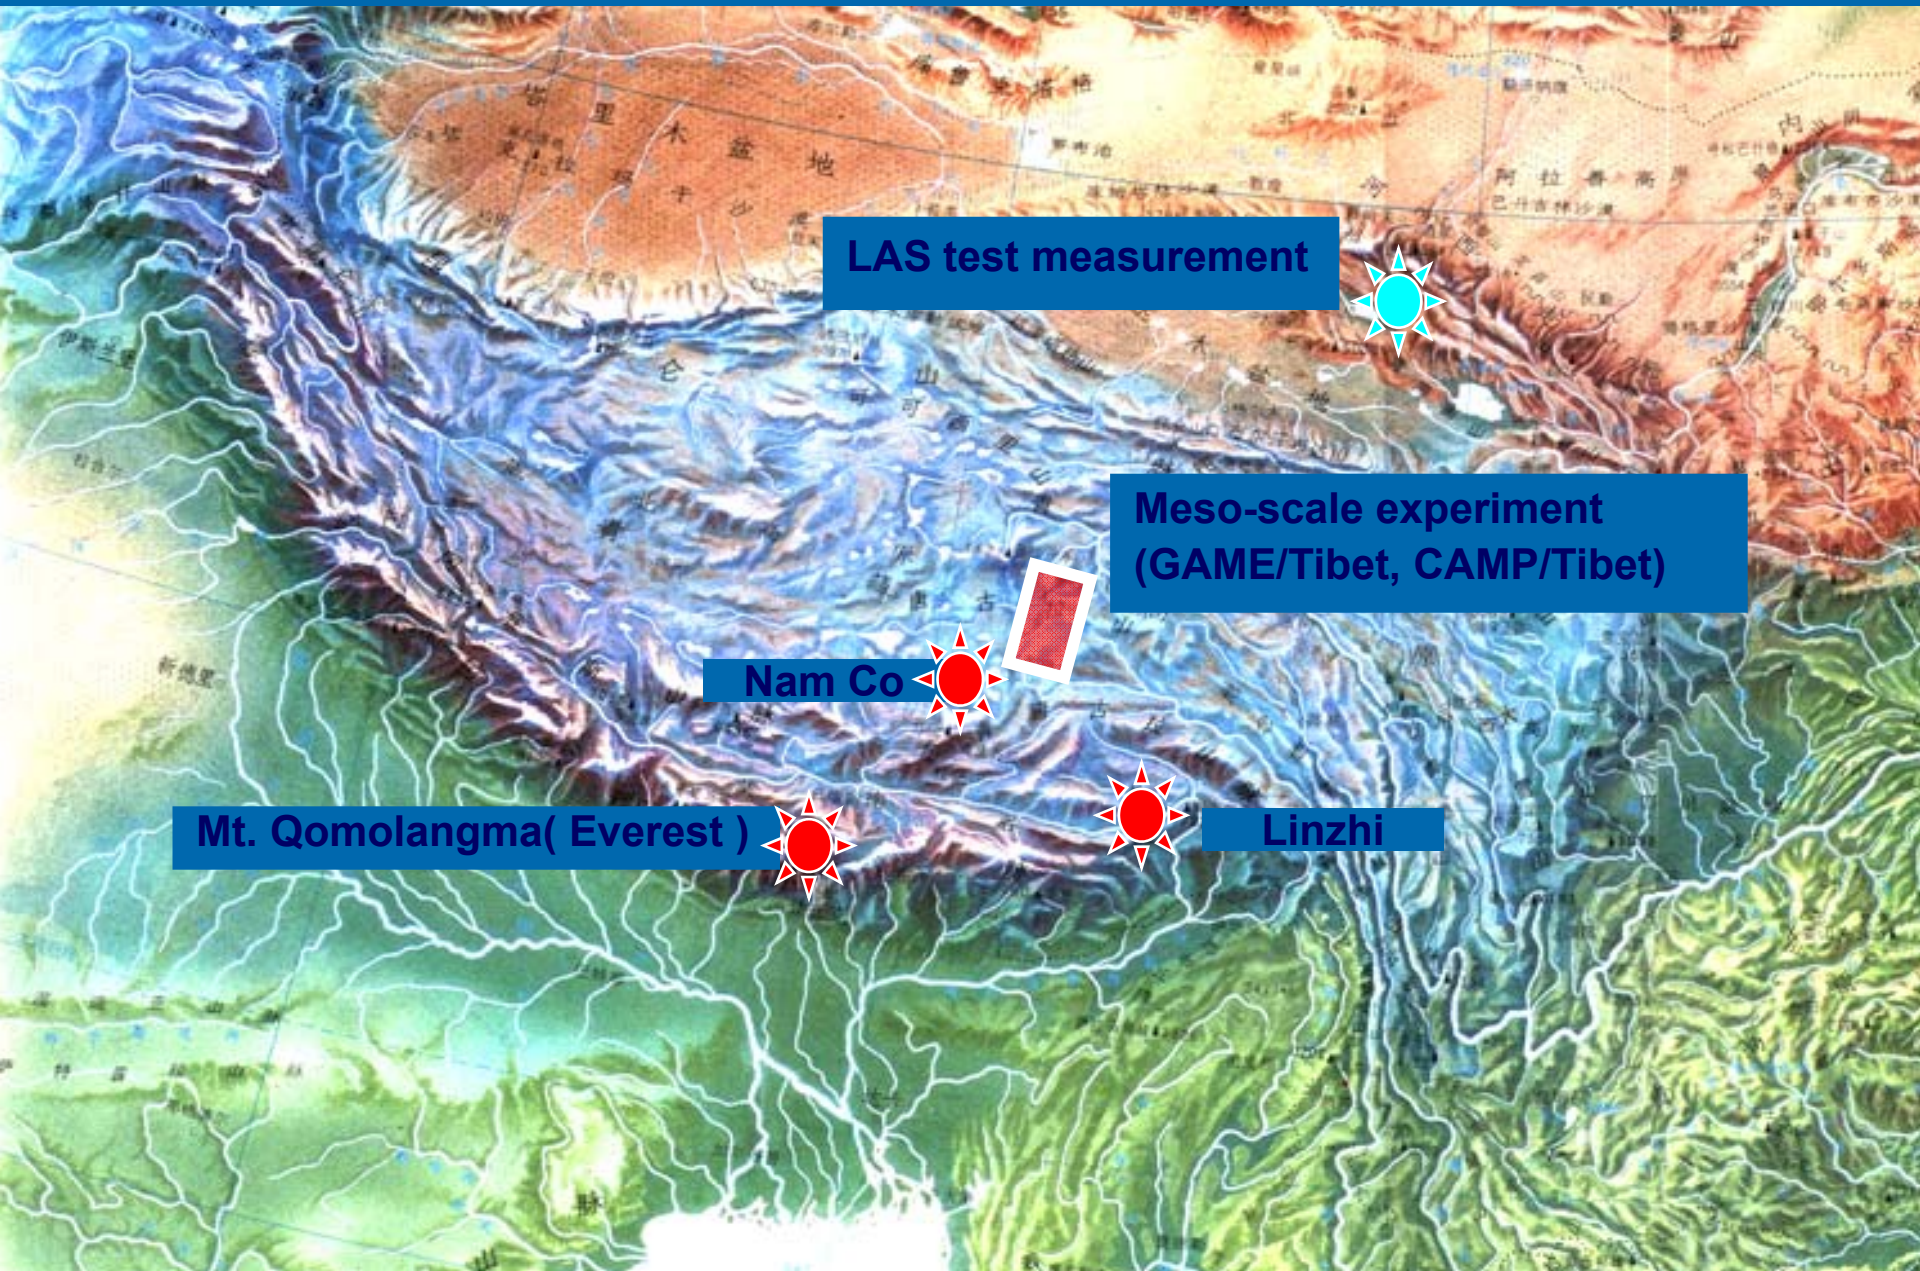

Ground-based observations of radiative and turbulent fluxes and soil moisture over the Tibetan Plateau

Atmospheric and soil data collection

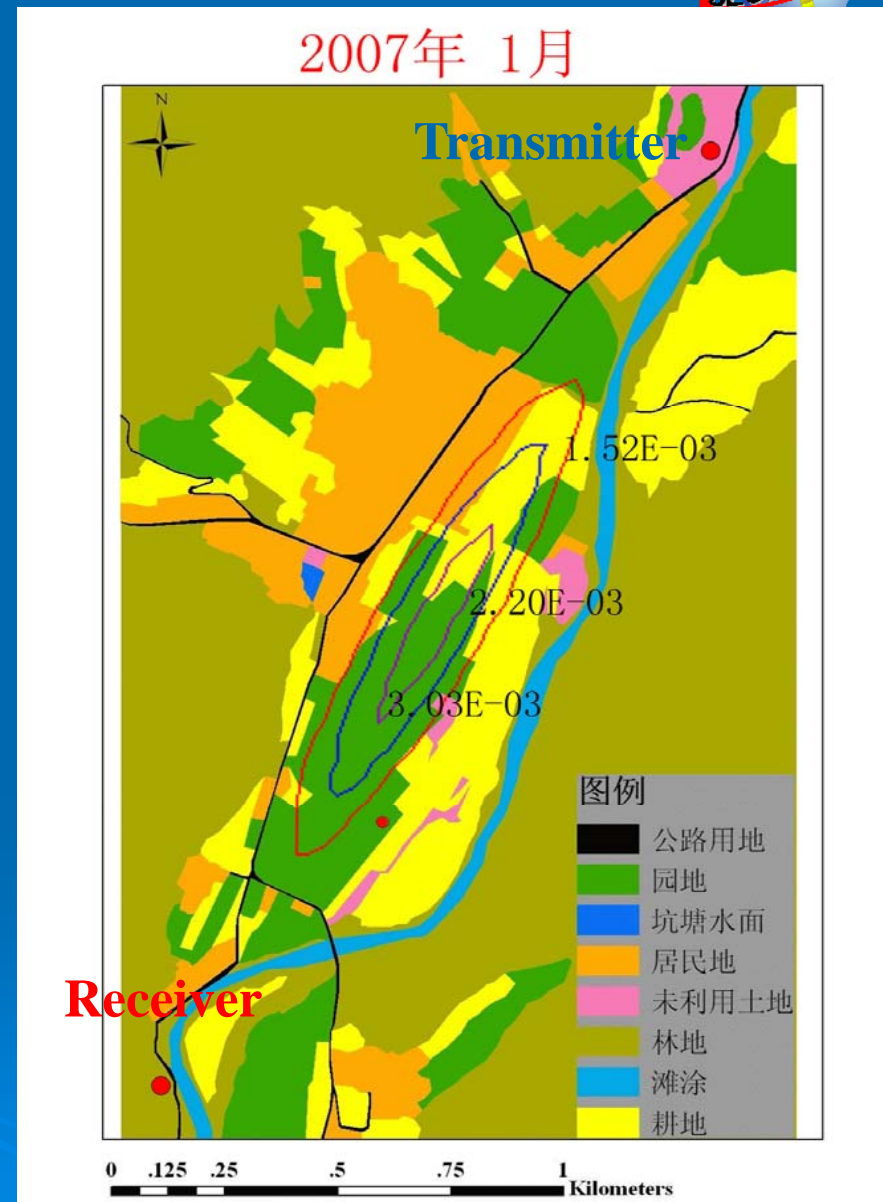

ITP, CAREERI, BNU, Univ. Bayreuth, Univ. Strasbourg, ITC, Univ. Ferrara

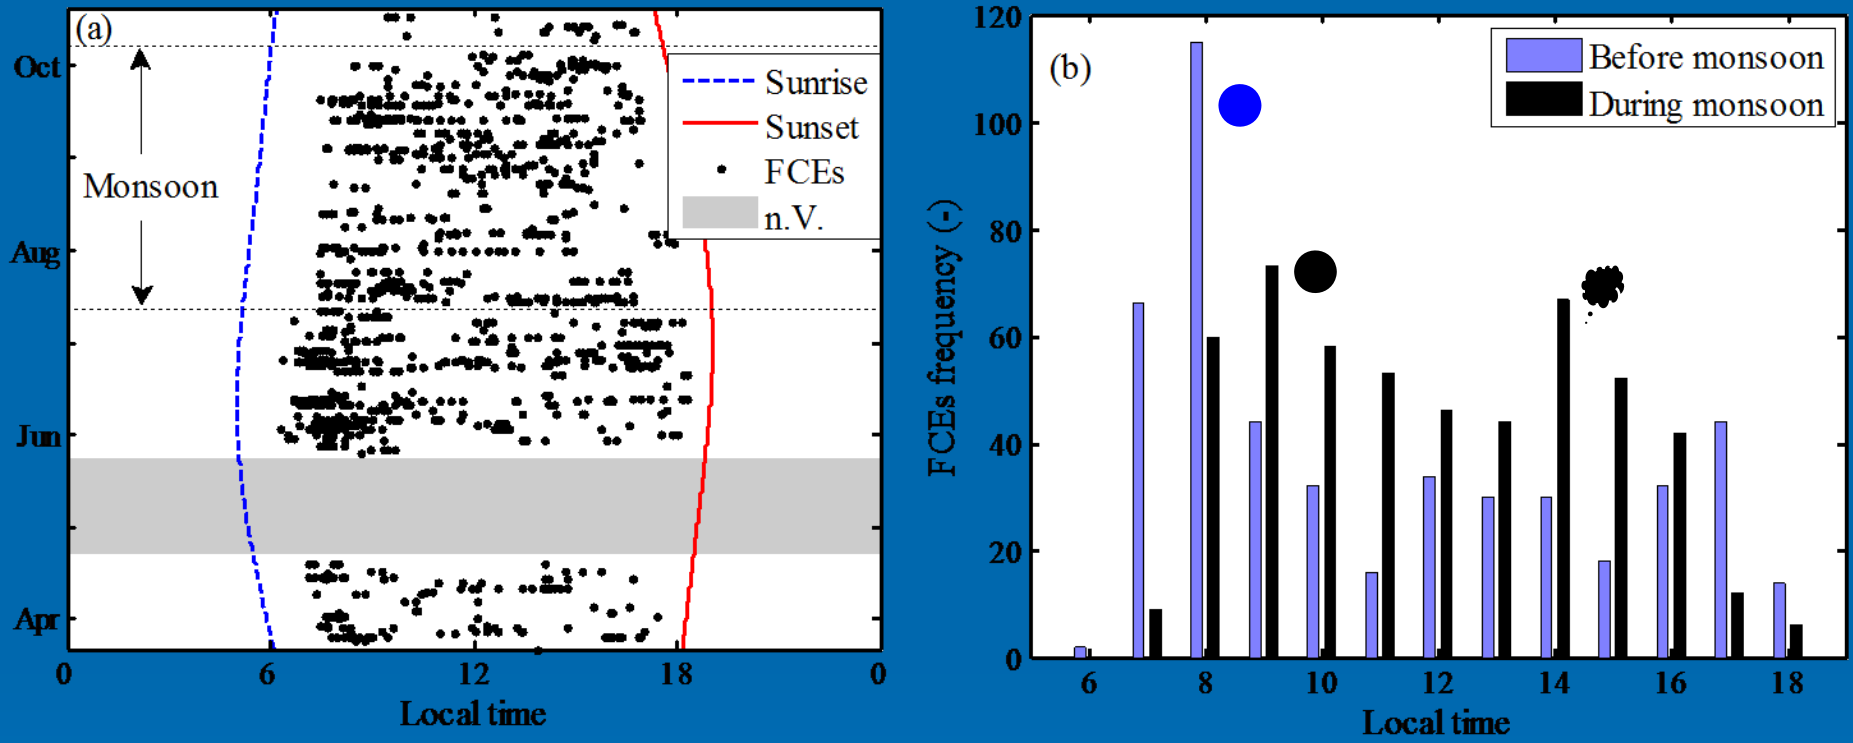

Eddy covariance, scintillometers and footprints

Monthly variation of LAS flux contribution area (8:00am -17:00pm Jan – Dec, 2007)

Free Convection Events in relation to monsoon

- Before monsoon, FCEs mostly occur in the morning hours. During the monsoon, the distribution is bi-modal with an afternoon mode closely related with cloud-cover

IHS of LST vs. NDVI correlation

Colors indicate θ values;

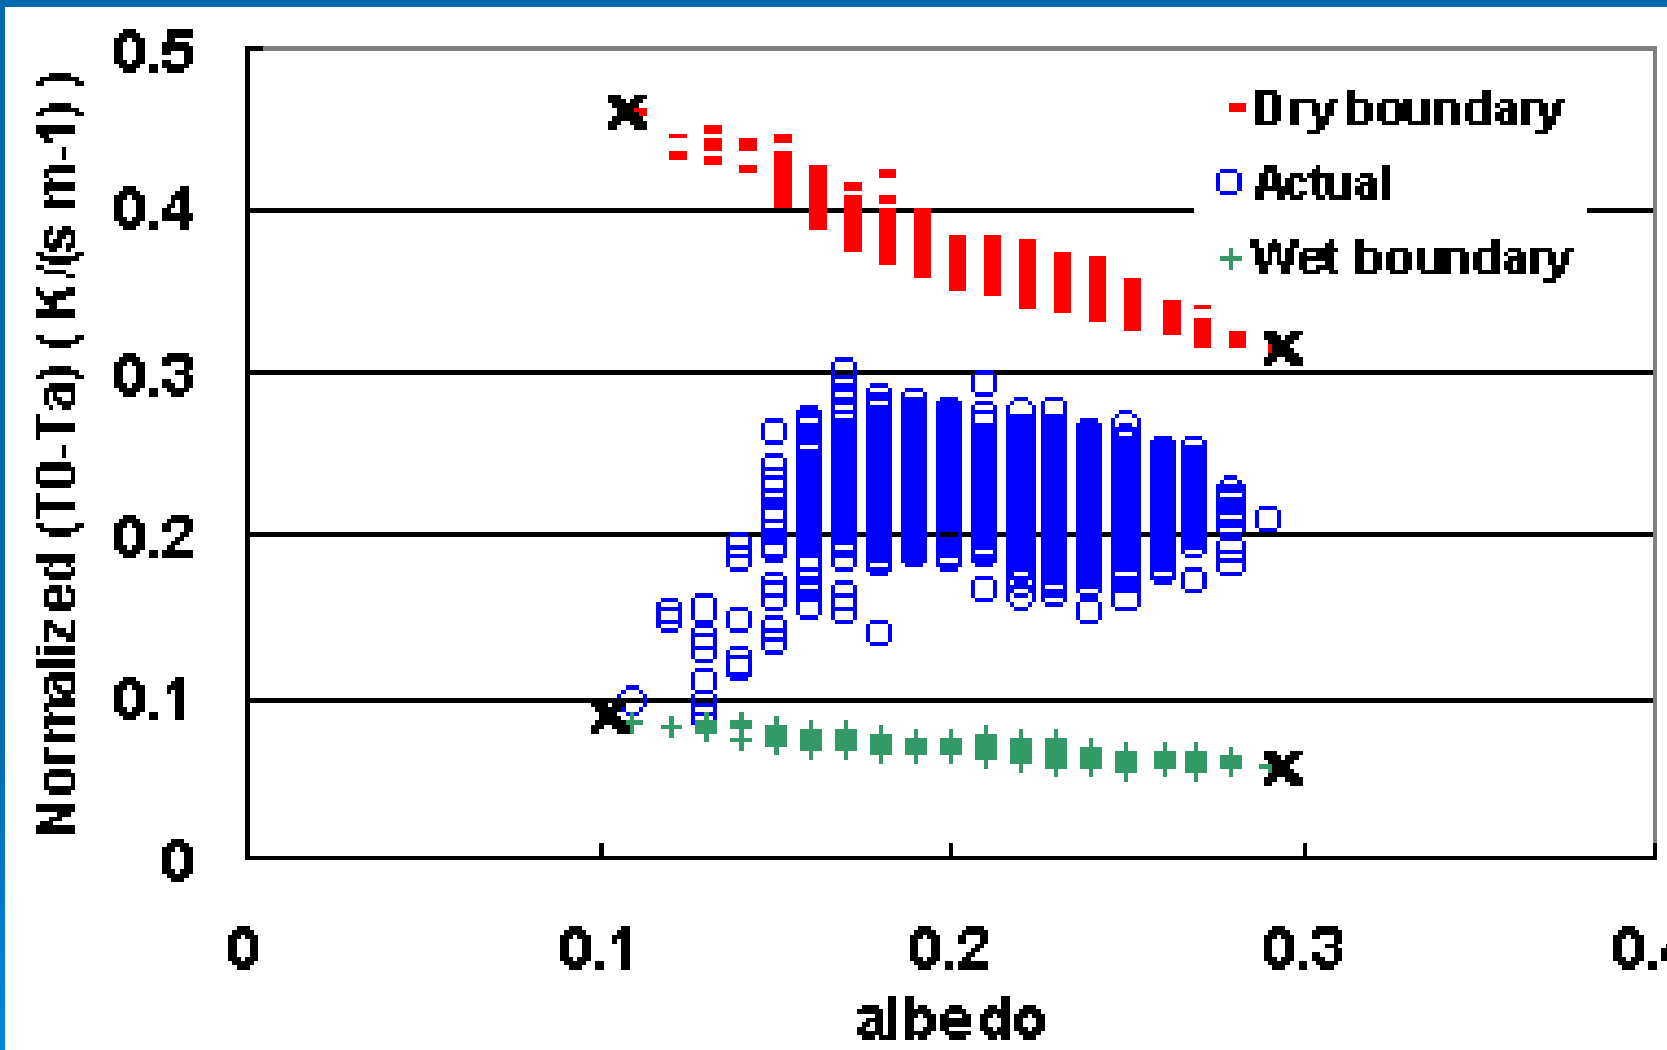

Intensity codes d values, characterizing NDVI-LST annual cycle;

Saturation codes R^2 values;

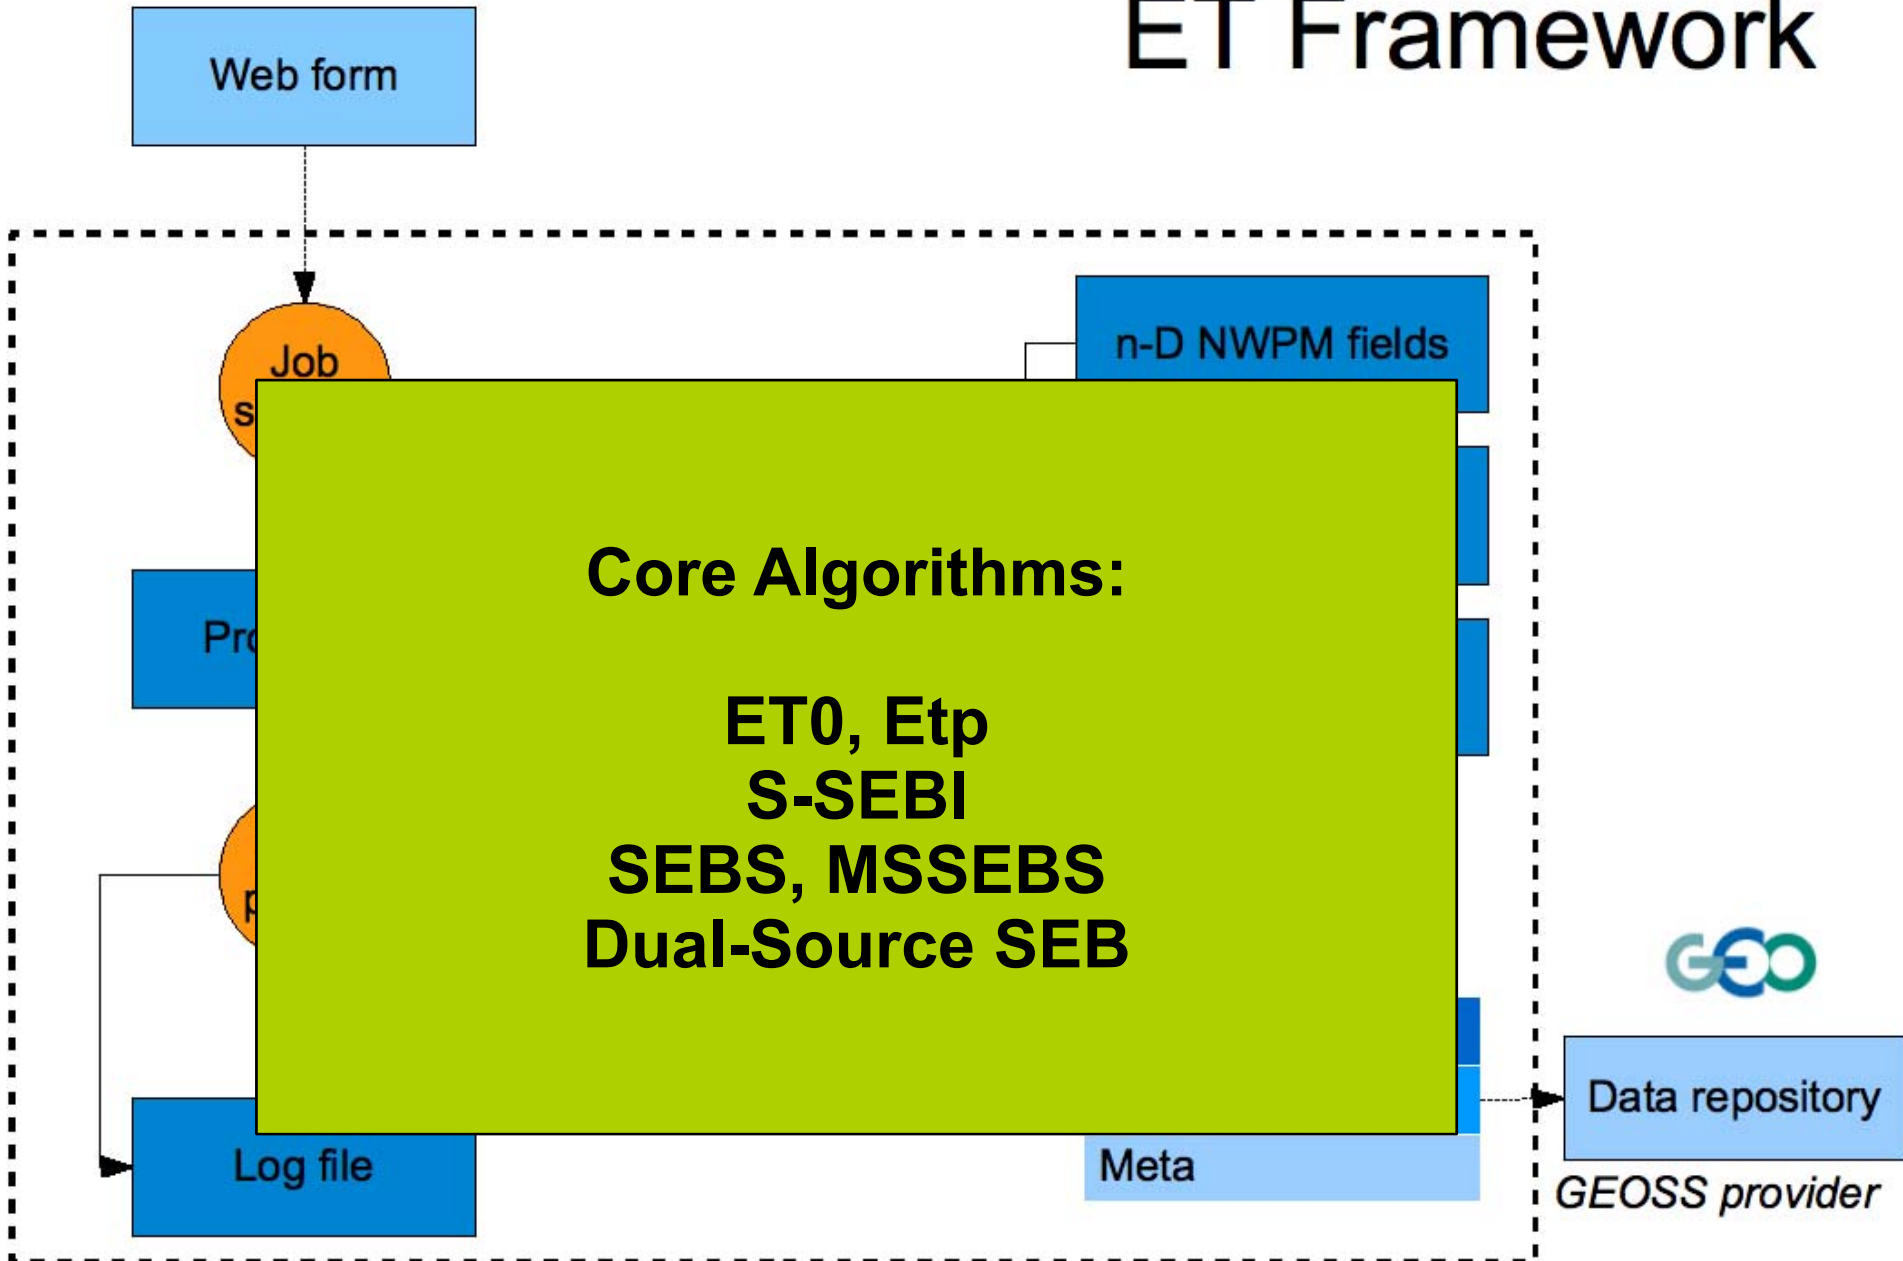

Julien and Sobrino, 2009

Menenti and Choudhury, 1993; Jia et al. 2001

ET Framework

Atm. model over QTP, 30' time step

T, p, q, u, v @ PBL
 q, p @ 2m

Pixel time of acquisition of LST

PBL Height, Nov 8th 2003 04Z

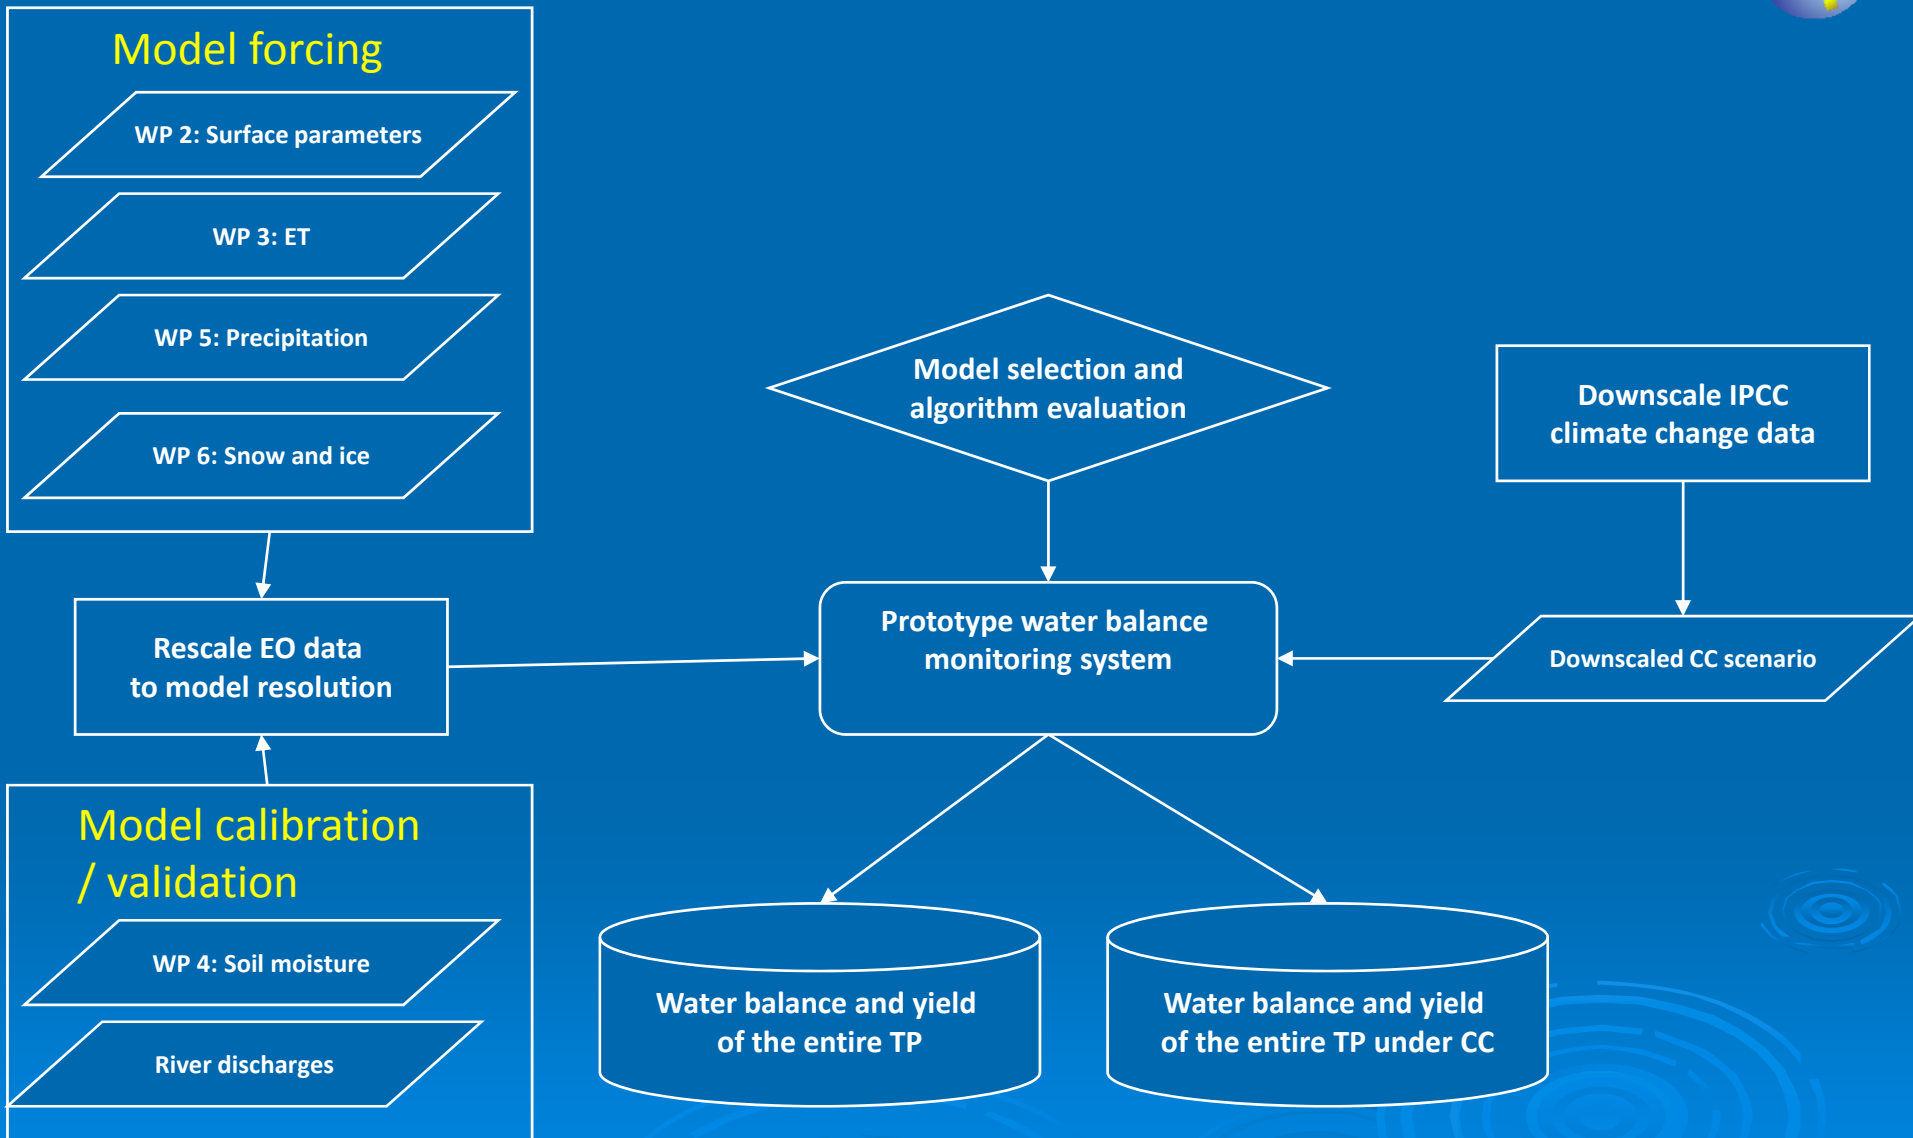

Air Temperature @ PBL, Nov 8th 2003 04Z

- IGSNNR, China
- NIT, Rorkee, India
- ITP, China
- CMA, China
- FutureWater, SME, the Netherlands
- Ariespace, SME, spin-off University of Naples, Italy

Model resolution:

- Regular grid of 5 km with regular surface area;
- Daily time step.

Each cell describes:

- The vertical flow of water through four compartments:
 - Canopy;
 - Three soil compartments.
- Soil and canopy are fed by rainfall and snowmelt and depleted by evapotranspiration;
- The transfer of runoff to the drainage network.

Between cells:

- Routing of water along drainage network;
- Surface water represents either streams or lakes that can cover multiple cells and buffer stream flow.

Plateau Water Balance: Data Requirements

input data

topographical:

- DEM
- slope length
- local drainage dir.

soil physical:

- FAO data*
- theta sat.
 - K sat.
 - ..

vegetation:

- Olson's global ecosystem classification*
- vegetation cover
 - interc. storage

routing:

- fraction of water
- lakes
- Manning
- river morphology

model forcing:

- rainfall
- actual evapotranspiration
- air temperature

TibWatMod

output data

waterbalance:

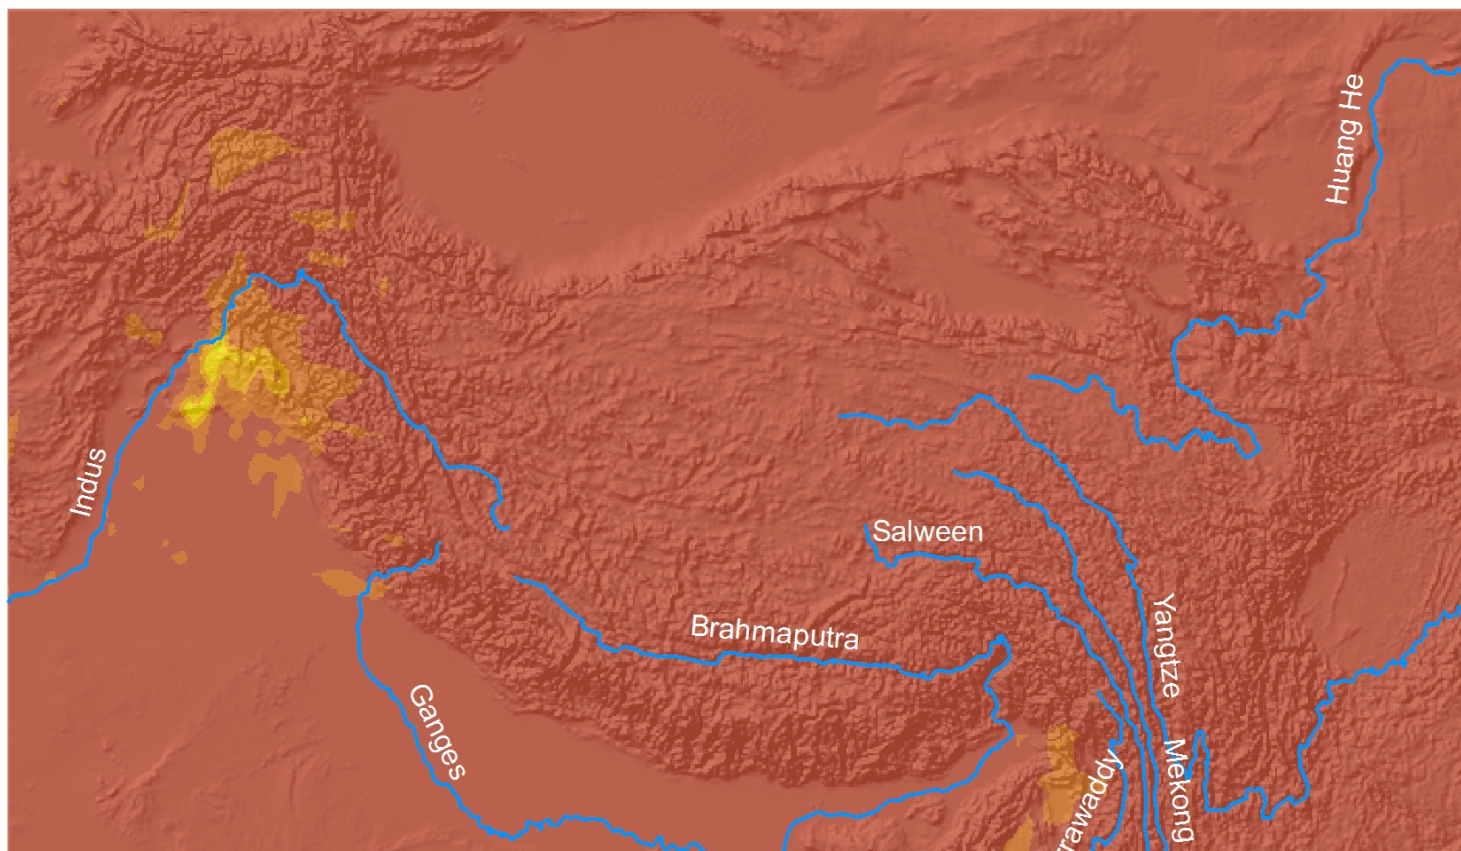

- soil moisture
- surface flow
- interflow
- baseflow
- snowcover
- storage in layers 1, 2 and 3
- groundwater recharge

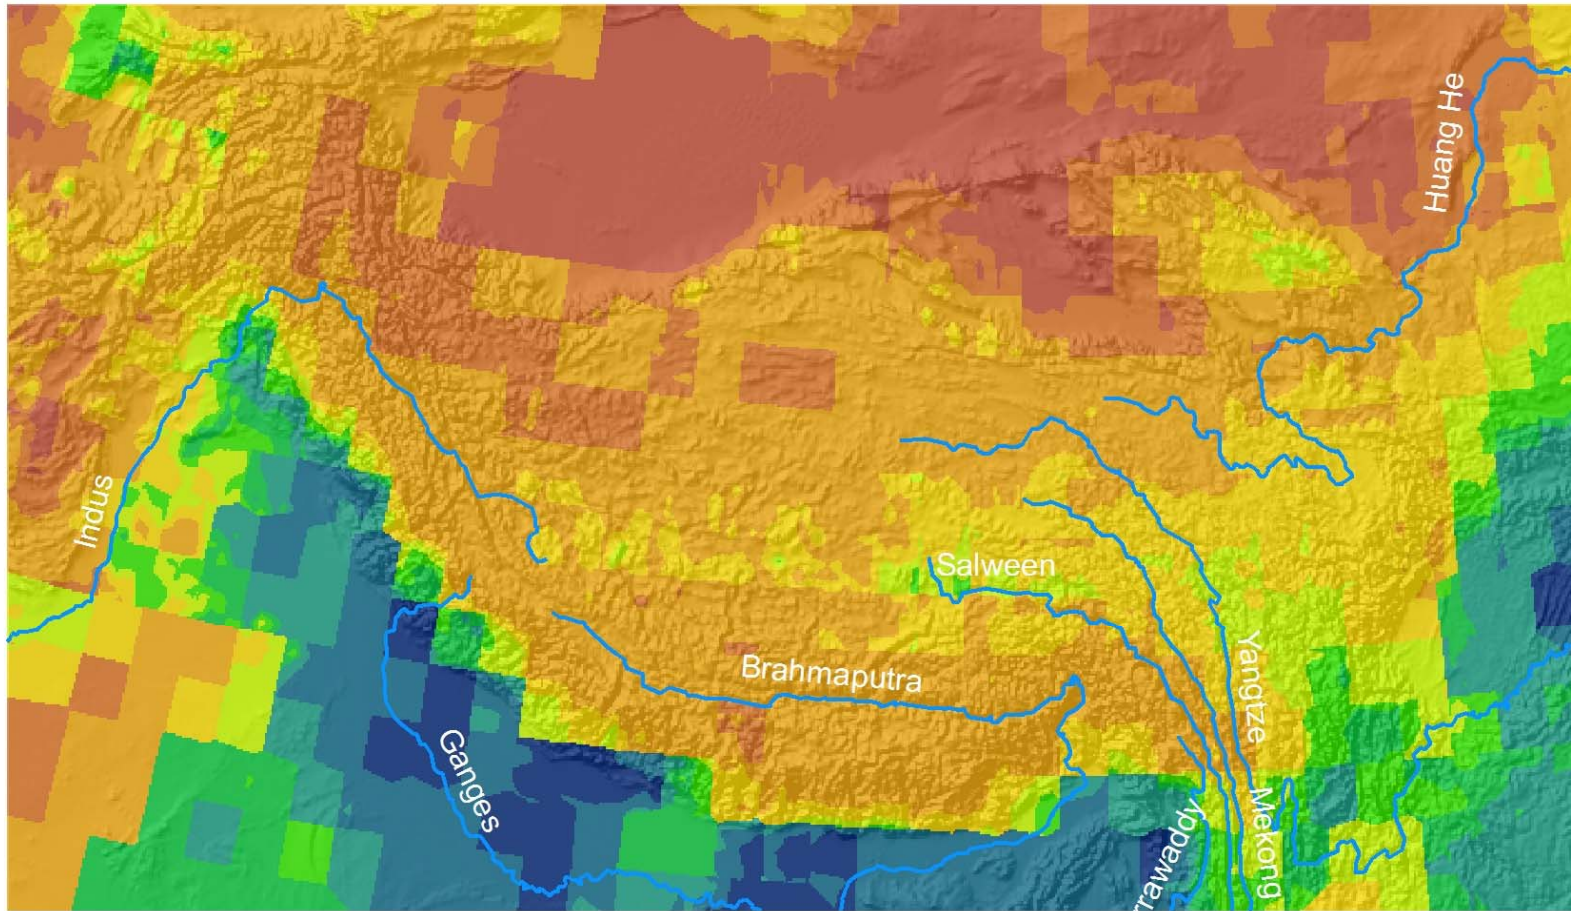

routing:

- discharge
- water levels

- **TibWatMod** is based on the PCRGLOB-WB (PC Raster GLOBal Water Balance) model (Van Beek, 2007; Univ. Utrecht, The Netherlands).
- Resolution of 5 km x 5km - 708 x 408 cells
- All data in Albers Equal Area projection
- Forcing
 - TRMM 3B42 precipitation
 - ERA40 ET_{act}
 - Air temperature

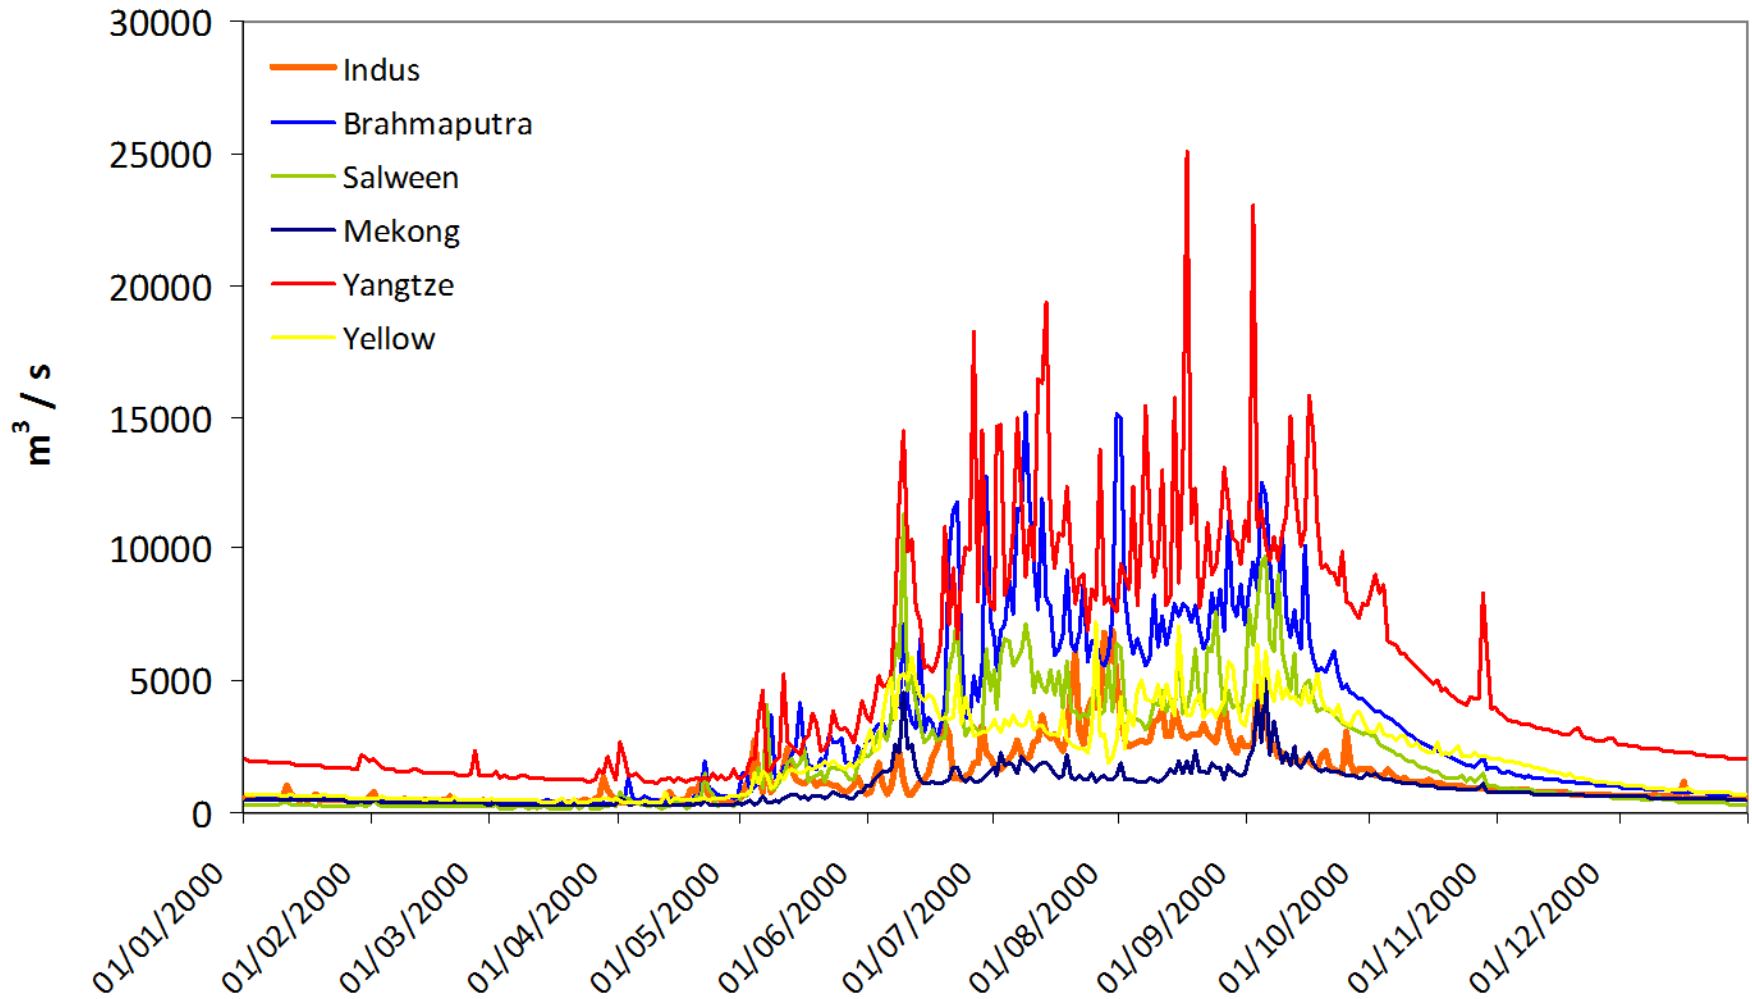

January

ET (mm / year)

A wide-angle landscape photograph showing a vast green valley with a large body of water in the foreground and rolling hills in the background under a blue sky with scattered clouds. The text 'Thank you!' is overlaid in the center in a large, bold, red font.

Thank you!
